General information

The E-factor calculations presented herein consider the synthetic E-factors, without considering any pretreatment/solubilization done to the lignin prior to the synthesis. E_{simple} is defined as the simple E-factor, where no solvents are included in the calculation; E_{complex} on the other hand also includes the solvent contribution to the E-factor.

If no final, isolated weight of lignin was reported in the respective manuscripts, a theoretical yield was calculated assuming 100% conversion of the reactive sites towards the main reaction, thus assuming the lowest possible E-Factor for the respective literature described reaction, following Equation S1:

$$m_f = m_i \left(1 + \Delta M_{\text{graft}} \left(\text{reactive sites in } \frac{\text{mol}}{\text{g}} \right) \right) \quad \text{Eq. S1}$$

where:

m_f = final mass of the modified lignin (g)

m_i = initial mass of pristine lignin (g)

ΔM_{graft} = increase in the molecular weight caused by the modification (g/mol)

Reactive sites = number of moieties participating in the reaction (depending on the reaction type) in mol/g.

This assumption represents a deliberate simplification that assumes 100% recovery of the modified lignin from the synthetic process, quantitative conversion, and considers only the main reaction. Despite its inherent simplifying nature, this assumption serves as a practical means to derive an estimate for the minimal attainable E-factor.

Abbreviation list

AlOH: aliphatic hydroxyl groups

ArOH: aromatic hydroxyl groups

COOH: carboxylic acid groups

Amino group functionalized lignin

Calculated E-factors for amination procedures are summarized in Table S1. Below the table, all calculations are listed to ensure reproducibility.

Table S1 - E factors for amination procedures.

Work	Modification	Functionalizing agent	E _{simple}	E _{complex}	E _{solvent} / %
She ¹	Amination (Mannich)	dimethylamine, ethylenediamine and diethylenetriamine	4.15 ^a	12.66 ^a	67
Li ²	Amination (Mannich)	dimethylamine	5.51 ^a	20.62 ^a	73
Jameel ³	Amination (Mannich)	dimethylamine, diethylamine	2.98	13.74	78
Biesalski ⁴	Amination (Mannich)	diethylenetriamine, 1,3-propylenediamine, ethylenediamine, ammonia	1.91- 5.04	12.93- 26.59	81-90
Kim ⁵	Amination	2-chloroethylamine hydrochloride	12.27	142	91
Rennekar ⁶	Amination	2-oxazolidinone	3.10	—	—

^a: no final weight of isolated product was reported, therefore final weight of the product was calculated based on theoretical yield.

Jiao, G.-J.; Peng, P.; Sun, S.-L.; Geng, Z.-C.; She, D. Amination of Biorefinery Technical Lignin by Mannich Reaction for Preparing Highly Efficient Nitrogen Fertilizer. *Int. J. Biol. Macromol.* **2019**, 127, 544–554

Starting materials: 5 g phenolated lignin (**7.79 mmol per g lignin reactive sites**, 0.13 mmol per g lignin ALOH, 5.84 mmol per g lignin ArOH), 20 g formaldehyde (666 mmol in 37% aq. solution, 54 g total weight considering water), 15 g ethylenediamine (250 mmol, in 40% aq. solution, 37.5 g total weight considering water), 0.16 g sodium hydroxide (4 mmol, 0.4 mol/L, 10.02 g total weight considering water).

Desired product: 7.81 g (theoretical yield)

$$m_f = m_i (1 + \Delta M_{\text{graft}} (\text{reactive sites in } \frac{\text{mol}}{\text{g}})) = 5 \text{ g} (1 + 72.1 \frac{\text{g}}{\text{mol}} (7.79 \times 10^{-3} \frac{\text{mol}}{\text{g}})) = 7.81 \text{ g}$$

$$E_{\text{simple}} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{40.16 - 7.81}{7.81} = 4.14$$

$$E_{\text{complex}} = \frac{\sum \text{starting materials (+solvents)} - \text{desired product}}{\text{desired product}} = \frac{106.52 - 7.81}{7.81} = 12.64$$

Solvent contribution to the E-factor:

$$\text{Solvent contribution} = \frac{\text{weight of solvent}}{\sum \text{starting materials (+solvent)} - \text{desired product}} = \frac{66.36}{98.72} = 0.672 = \mathbf{67.2\%}$$

Du, X.; Li, J.; Lindström, M. E. Modification of Industrial Softwood Kraft Lignin Using Mannich Reaction with and without Phenolation Pretreatment. *Ind. Crops Prod.* **2014**, 52, 729–735

Starting materials: 0.1 g LignoBoost lignin from spruce kraft black liquor (**1.96 mmol per g lignin reactive sites**, 1.60 mmol per g lignin AlOH, 0.45 mmol per g lignin COOH, 3.59 mmol per g lignin ArOH), 0.165 g formaldehyde (5.5 mmol, in 37% aq. solution, 0.446 g total weight considering water), 0.248 g dimethylamine (5.5 mmol, in 40% aq. solution, 0.62 g total weight considering water), 0.21 g acetic acid (3.5 mmol), 1.024 g (80% solution of 1,4-dioxane in water).

Desired product: 0.111 g (theoretical yield)

$$m_f = m_i \left(1 + \Delta M_{\text{graft}} \left(\text{reactive sites in } \frac{\text{mol}}{\text{g}}\right)\right) = 0.1 \text{ g} \left(1 + 57.06 \frac{\text{g}}{\text{mol}} (1.96 \times 10^{-3} \frac{\text{mol}}{\text{g}})\right) =$$

$$0.111 \text{ g}$$

$$E_{\text{simple}} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{0.723 - 0.111}{0.111} = 5.51$$

$$E_{\text{complex}} = \frac{\sum \text{starting materials (+solvents)} - \text{desired product}}{\text{desired product}} = \frac{2.4 - 0.111}{0.111} = 20.62$$

Solvent contribution to the E-factor:

$$\text{Solvent contribution} = \frac{\text{weight of solvent}}{\sum \text{starting materials (+solvent)} - \text{desired product}} = \frac{1.677}{2.29} = 0.732 = \mathbf{73.2\%}$$

Kollman, M.; Jiang, X.; Thompson, S. J.; Mante, O.; Dayton, D. C.; Chang, H.; Jameel, H. Improved Understanding of Technical Lignin Functionalization through Comprehensive Structural Characterization of Fractionated Pine Kraft Lignins Modified by the Mannich Reaction. *Green Chem.* **2021**, 23 (18), 7122–7136

Starting materials: 0.1 g BioChoice[®] lignin, 0.150 g formaldehyde (5 mmol in 37% aq. solution, 0.406 g total weight considering water), 0.2254 g dimethylamine (5 mmol), 1.03 g 1,4-dioxane.

Volume of 0.5M NaOH solution used to adjust the pH is not reported.

Desired product: 0.1192 g (isolated yield)

$$E_{\text{simple}} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{0.475 - 0.1192}{0.1192} = 2.98$$

$$E_{\text{complex}} = \frac{\sum \text{starting materials (+solvents)} - \text{desired product}}{\text{desired product}} = \frac{1.76 - 0.1192}{0.1192} = 13.78$$

Solvent contribution to the E-factor:

$$\text{Solvent contribution} = \frac{\text{weight of solvent}}{\sum \text{starting materials (+solvent)} - \text{desired product}} = \frac{1.286}{1.64} = 0.783 = \mathbf{78.3\%}$$

Co-Curing of Epoxy Resins with Aminated Lignins: Insights into the Role of Lignin Homo Crosslinking during Lignin Amination on the Elastic Properties. *Holzforschung* **2021**, 75 (4), 390–398

Starting materials: 40 g Softwood kraft lignin, 3.2 g sodium hydroxide (80 mmol, 404 g of total solution considering water), 18.62 g formaldehyde (620 mmol, in 35% aq. solution, 53.2 g total weight considering water), 64 g diethylene triamine (DETA, 620 mmol); or 45.9 g of 1,3-propylenediamine (PDA, 619 mmol); or 60.1 g of ethylenediamine (EDA, 1000 mmol); or 17.5 g of ammonia (1028 mmol, in 25% aq. solution, 70 g total weight considering water).

Desired product(s):

diethylenetriamine-functionalized lignin KL-DETA: 40.3 g (isolated yield)

1,3-propylenediamine-functionalized lignin KL-PDA: 37 g (isolated yield)

ethylenediamine-functionalized lignin KL-EDA: 20.2 g (isolated yield)

ammonia-functionalized lignin KL-NH3: 25.0 g (isolated yield)

Desired product	Raw materials (total weight in g without solvent)	Raw materials (total weight in g with solvent)	Desired product (g)	E _{simple}	E _{complex}	Solvent contribution to the E-factor
KL-DETA	125.82	561.2	40.3	2.12	12.93	84%
KL-PDA	107.72	543.1	37.0	1.91	13.68	86%
KL-EDA	121.92	557.3	20.2	5.04	26.59	81%
KL-NH3	79.32	567.2	25.0	2.17	21.69	90%

Chen, J.; An, L.; Bae, J. H.; Heo, J. W.; Han, S. Y.; Kim, Y. S. Green and Facile Synthesis of Aminated Lignin-Silver Complex and Its Antibacterial Activity. *Ind. Crops Prod.* **2021**, 173, 114102

Starting materials: 1 g kraft lignin, 3.22 g 2-chloroethylamine hydrochloride (27.76 mmol), 6 g sodium hydroxide (150 mmol, 106 g of total solution considering water).

Desired product: 0.77 g (isolated yield)

$$E_{\text{simple}} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{10.22 - 0.77}{0.77} = 12.27$$

$$E_{\text{complex}} = \frac{\sum \text{starting materials (+solvents)} - \text{desired product}}{\text{desired product}} = \frac{110.22 - 0.77}{0.77} = 142.14$$

Solvent contribution to the E-factor:

$$\text{Solvent contribution} = \frac{\text{weight of solvent}}{\sum \text{starting materials (+solvent)} - \text{desired product}} = \frac{100}{109.45} = 0.914 = \mathbf{91.4\%}$$

Liu, L.; Wan, X.; Chen, S.; Boonthamrongkit, P.; Sipponen, M.; Rennekar, S. Solventless Amination of Lignin and Natural Phenolics Using 2-Oxazolidinone. *ChemSusChem* **2023**, 16 (15), e202300276.

Starting materials: 2 g softwood kraft lignin (5.9 mmol reactive sites per g lignin, total sum of ArOH and COOH groups), 6.16 g 2-oxazolidinone (70.8 mmol, 6 equiv. in respect to the sum of ArOH and COOH groups), 0.12 g sodium hydroxide (2.95 mmol, 0.25 equiv.)

Desired product: 2.02 g (isolated yield)

$$E_{simple} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{8.28 - 2.02}{2.02} = 3.10$$

$E_{complex} = E_{simple}$ because no additional solvents are used.

Epoxide functionalized lignin

Calculated E-factors for epoxidation procedures are summarized below. Table S2 provides an overview and all calculations are listed below to ensure reproducibility.

Table S2 - E-factors for epoxidation procedures.

Work	Modification	Functionalizing agent	E _{simple}	E _{complex}	E _{solvent} / %	E _{sequence}
Meier ⁷	Glycidylation	epichlorohydrin	6.35	—	—	—

E-factor of complete sequence

Reaction 1: A (fatty acids) + Reagents → B (epoxidized Fatty Acids(eFA))

Reaction 2: **B (eFA)** + **C (lignin)** + **Reagents** → **D (lignin epoxide)**

Reaction 1: $E_{\text{complex}}: 4.78 \frac{\text{kg waste}}{\text{kg eFA}}$

Reaction 2: $E_{\text{complex}}: 22.74 \frac{\text{kg waste}}{\text{kg lignin epoxide}}$; **Multiplier Reaction 1:** $\frac{\text{kg eFA}}{\text{kg lignin epoxide}} = \frac{38.5}{12.05} = 3.20$

E_{sequence}: $22.74 \frac{\text{kg waste}}{\text{kg lignin epoxide}}$ (**Reaction 2**)

+ $4.78 \frac{\text{kg waste}}{\text{kg eFA}} \times 3.20 \frac{\text{kg eFA}}{\text{kg lignin epoxide}}$ (**Reaction 1**)

= $38.00 \frac{\text{kg waste}}{\text{kg lignin epoxide}}$

Laurichesse, S.; Huillet, C.; Avérous, L. Original polyols based on organosolv lignin and fatty acids: new bio-based building blocks for segmented polyurethane synthesis. *Green Chem.* **2014**, 16, 3958-3970.

Chlorination of oleic acid

Starting materials: 40.0 g oleic acid (142 mmol), 35.95 g oxalyl chloride (283 mmol, 2.00 equiv.), 270.6 g ethyl acetate (300 ml)

Desired product: 42.6 g (142 mmol, theoretical yield)

$$E_{simple} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{75.95 - 42.6}{42.6} = 0.78$$

$$E_{complex} = \frac{\sum \text{starting materials (+solvents)} - \text{desired product}}{\text{desired product}} = \frac{346.55 - 42.6}{42.6} = 7.13$$

$$\text{Solvent contribution} = \frac{\text{weight of solvent}}{\sum \text{starting materials (+solvent)} - \text{desired product}} = \frac{270.6}{304.02} = 0.890 = \mathbf{89.0\%}$$

Esterification of organosolv lignin with oleyl chloride

Starting materials: 30 g organosolv lignin (2.26 mmol OH per g lignin), 40.7 g oleyl chloride (135 mmol, 2.00 equiv.).

Desired product: 45.0 g (isolated yield)

$$E_{simple} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{70.7 - 45.0}{45.0} = 0.57$$

$$E_{complex} = E_{simple} \text{ because no additional solvents are used.}$$

Epoxidation of oleic acid lignin ester

Starting materials: 45 g esterified lignin (1.6 mmol double bonds per g lignin), 10.95 g peracetic acid (144 mmol, 2.00 equiv.), 331.25 g dichloromethane (250 ml).

Desired product: 46.15 g (theoretical yield)

$$m_f = m_i \left(1 + \Delta M_{graft} \left(\text{reactive sites in } \frac{\text{mol}}{g} \right) \right)$$

$$m_f = 45.0 \text{ g} \left(1 + 15.999 \frac{\text{g}}{\text{mol}} (1.60 \times 10^{-3} \frac{\text{mol}}{\text{g}}) \right) = 46.15 \text{ g}$$

$$E_{simple} = \frac{\Sigma \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{55.95 - 46.15}{46.15} = 0.21$$

$$E_{complex} = \frac{\sum \text{starting materials (+solvents)} - \text{desired product}}{\text{desired product}} = \frac{387.2 - 46.15}{46.15} = 7.39$$

$$\text{Solvent contribution} = \frac{\text{weight of solvent}}{\sum \text{starting materials (+solvent)} - \text{desired product}} = \frac{331.25}{341.05} = 0.971 = \mathbf{97.1\%}$$

Reaction 2: B (HEL) + _____ + Reagents → C (lignin ester)

Reaction 1: $E_{\text{complex}}: 2.19 \frac{\text{kg waste}}{\text{kg HEL}}$

Reaction 2: $E_{\text{complex}} \cdot 0.94 \frac{\text{kg waste}}{\text{kg lignin ester}}$; **Multiplier Reaction 1:** $\frac{\text{kg HEL}}{\text{kg lignin ester}} = \frac{5}{5} = 1.00$

E_{sequence}: $0.94 \frac{\text{kg waste}}{\text{kg lignin ester}}$ (Reaction 2)

$+ 2.19 \frac{\text{kg waste}}{\text{kg HEL}} \times 1.00 \frac{\text{kg HEL}}{\text{kg lignin ester}}$ (Reaction 1)

$= 3.13$

Starting materials: 5 g hydroxyethylated lignin (**4.71 mmol reactive sites per g lignin**: 4.30 mmol AlOH per g lignin, 0.41 mmol ArOH per g lignin, 0.02 mmol COOH per g lignin), 45.5 g octanoic acid (50 ml, 316 mmol, 13.4 equiv.).

Desired product: 5 g (isolated yield)

$$E_{simple} = \frac{50.5 - 5.00 - 40.95}{5.00} = 0.91$$

E-factor of sequence: hydroxyethylation and esterification with octanoic acid (recycling)

Reaction 2: B (HEL) + _____ + Reagents → C (lignin ester)

Reaction 2: $E_{\text{complex}} \cdot 0.91 \frac{\text{kg waste}}{\text{kg lignin ester}}$; **Multiplier Reaction 1:** $\frac{\text{kg HEL}}{\text{kg lignin ester}} = \frac{5}{5} = 1.00$

28

Esterification of hydroxyethylated lignin with oleic acid (recycling)

Starting materials: 5 g hydroxyethylated lignin (**4.73 mmol reactive sites per g lignin**: 4.30 mmol AlOH per g lignin, 0.41 mmol ArOH per g lignin, 0.02 COOH per g lignin), 44.5 g oleic acid (50 ml, 158 mmol, 6.66 equiv.).

Recycled starting materials: 40.05 g oleic acid (90%)

Desired product: 3 g (isolated yield)

$$E_{simple} = \frac{\sum \text{starting materials} - \text{desired product} - \text{recycled oleic acid}}{\text{desired product}} = \frac{49.5 - 3.0 - 40.05}{3.0}$$

$$E_{simple} = \frac{49.5 - 3.00 - 40.05}{3.00} = 2.15$$

$E_{complex} = E_{simple}$ because no additional solvents are used.

E-factor of sequence: hydroxyethylation and esterification with oleic acid (recycling)

Reaction 1: A (lignin) + Reagents → B (hydroxyethylated lignin (HEL))

Reaction 2: B (HEL) + _____ + Reagents → C (lignin ester)

Reaction 1: $E_{\text{complex}}: 2.19 \frac{\text{kg waste}}{\text{kg HEL}}$

Reaction 2: $E_{\text{complex}}: 2.15 \frac{\text{kg waste}}{\text{kg lignin ester}};$ **Multiplier Reaction 1:** $\frac{\text{kg HEL}}{\text{kg lignin ester}} = \frac{5}{3} = 1.667$

$$\begin{aligned} E_{\text{sequence}} &= 2.15 \frac{\text{kg waste}}{\text{kg lignin ester}} \text{ (Reaction 2)} \\ &+ 2.19 \frac{\text{kg waste}}{\text{kg HEL}} \times 1.667 \frac{\text{kg HEL}}{\text{kg lignin ester}} \text{ (Reaction 1)} \\ &= 5.80 \end{aligned}$$

Adjaoud, A.; Dieden, R.; Verge, P. Sustainable Esterification of a Soda Lignin with Phloretic Acid. *Polymers*. **2021**, 13, 637.

Starting materials: 2 g soda lignin (**2.00 mmol reactive sites per g lignin**: 2.00 mmol AIOH per g lignin, 3.94 mmol ArOH per g lignin, 0.78 mmol CO₂H per g lignin), 3.32 g phloretic acid (20.0 mmol, 5.00 equiv.), 500 mg *para*-toluene sulfonic acid (2.90 mmol, 72.6 mol%).

Desired product: 2.66 g (theoretical yield)

$$m_f = m_i \left(1 + \Delta M_{\text{graft}} \left(\text{reactive sites in } \frac{\text{mol}}{\text{g}} \right) \right)$$

$$m_f = 2.0 \text{ g} \left(1 + 165.168 \frac{\text{g}}{\text{mol}} (2.00 \times 10^{-3} \frac{\text{mol}}{\text{g}}) \right) = 2.66 \text{ g}$$

$$E_{\text{simple}} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{5.82 - 2.66}{2.66} = 1.19$$

$E_{\text{complex}} = E_{\text{simple}}$ because no additional solvents are used.

Multiple bond functionalized lignin

Calculated E-factors for multiple bond insertion procedures are summarized in Table S4, all calculations are listed to ensure reproducibility.

Table S4 - Calculated E-factors for multiple bond insertion.

Work	Modification	Functionalizing agent	E _{simple}	E _{complex}	E _{sequence}
Rennekar ²²	Hydroxyethylation	Ethylene carbonate	4.80	—	7.76
	Esterification	Acrylic acid	3.07		
Meier and Over ²³	Allylation	Diallyl carbonate	5.42 -9.43	—	—
Meier et al. ²⁴	Allylation	Diallylcarbonate	1.87 ^a	—	—
Johansson ²⁵	Allylation	Diallyl carbonate	2.09 ^a	—	—
Avérous ²⁶	Vinylation	Vinyl ethylene carbonate	6.01	—	—

^a: no final weight of isolated product was reported, therefore final weight of the product was calculated based on theoretical yield.

Functional Lignin Building Blocks: Reactive Vinyl Esters with Acrylic Acid, Qi Hua, Li-Yang Liu, Mijung Cho, Muzaffer A. Karaaslan, Huaiyu Zhang, Chang Soo Kim, and Scott Rennekar; Biomacromolecules 2023, 24, 2, 592–603.

Hydroxyethylation of softwood kraft lignin

10 g softwood kraft lignin (3.9 mmol ArOH per g lignin), 50 g ethylene carbonate (568 mmol, 14.5 equiv. in respect of the total of ArOH), 0.8 g Na₂CO₃ (7.55 mmol, 0.2 equiv.).

Desired product: 10.5 g (isolated yield)

$$E_{simple} \text{ hydroxyethylation} = \frac{\sum \text{starting materials step 1} - \text{desired product 1}}{\text{desired product 1}} = \frac{60.8 - 10.5}{10.5} = 4.8$$

Esterification of hydroxyethylated lignin with acrylic acid

1 g hydroxyethylated lignin (4.3 mmol AIOH per g lignin, 0.38 mmol per g lignin ArOH, 0.11 mmol per g lignin COOH), 3.15 g acrylic acid (43.7 mmol, 3 ml, d=1.05 g/ml)

Desired product: 1.02 g (isolated yield)

$$E_{simple} \text{ esterification} = \frac{\sum \text{starting materials step 2} - \text{desired product 2}}{\text{desired product 2}} = \frac{4.15 - 1.02}{1.02} = 3.07$$

E-factor of whole sequence

Reaction 1: A (lignin) + Reagents → B (hydroxyethylated lignin(HEL))

Reaction 2: B (hydroxyethylated lignin) + Reagents → C (final product)

Reaction 1: $E_{\text{complex}}: 4.8 \frac{\text{kg waste}}{\text{kg HEL}}$

Reaction 2: $E_{\text{complex}}: 3.07 \frac{\text{kg waste}}{\text{kg final product}}$; Multiplier Reaction 1: $\frac{\text{kg HEL}}{\text{kg final product}} = \frac{1}{1.02} = 0.978$

$E_{\text{sequence}}:$

$$3.07 \frac{\text{kg waste}}{\text{kg final product}} (\text{Reaction 2})$$
$$+ 4.8 \frac{\text{kg waste}}{\text{kg HEL}} \times 0.978 \frac{\text{kg HEL}}{\text{kg final product}} (\text{Reaction 1})$$
$$= 7.76 \frac{\text{kg waste}}{\text{kg final product}}$$

Over, L. C.; Meier, M. A. R. Sustainable Allylation of Organosolv Lignin with Diallyl Carbonate and Detailed Structural Characterization of Modified Lignin. *Green Chem.* **2016**, 18 (1), 197–207.

Starting materials: 0.15 g organosolv lignin (6.1 mmol OH per g lignin), 1.30 g diallyl carbonate (9.15 mmol DAC, 10 equiv.), 0.295 g tetrabutylammonium bromide (0.915 mmol TBAB, 1 equiv.)

Procedure for recovery of TBAB: obtained allylated lignin 0.140 g, recovered TBAB: 0.285 g (97%)

Procedure for recovery of DAC: obtained allylated lignin 0.146 g, DAC recovered: 0.807 g (62%)

$$E_{\text{simple}}(\text{TBAB recov.}) = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{1.46 - 0.14}{0.14} = 9.43$$

$$E_{\text{simple}}(\text{DAC recov.}) = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{0.938 - 0.146}{0.146} = 5.42$$

$E_{\text{complex}} = E_{\text{simple}}$ because no additional solvents are used.

Over, L. C.; Hergert, M.; Meier, M. A. R. *Metathesis Curing of Allylated Lignin and Different Plant Oils for the Preparation of Thermosetting Polymer Films with Tunable Mechanical Properties*. *Macromol. Chem. Phys.* **2017**, 218 (16), 1700177.

Starting materials: 30 g organosolv lignin (**6.1 mmol g⁻¹ reactive sites**), 76 g diallyl carbonate (535 mmol DAC, 3 equiv.), 11.9 g tetrabutylammonium bromide (37 mmol TBAB, 0.2 equiv.)

Recovery of TBAB: 10.9 g (92%)

Desired product: 37.33 g (theoretical yield)

$$m_f = m_i \left(1 + \Delta M_{\text{graft}} \left(\text{reactive sites in } \frac{\text{mol}}{\text{g}}\right)\right) = 30 \text{ g} \left(1 + 40.032 \frac{\text{g}}{\text{mol}} \left(6.1 \times 10^{-3} \frac{\text{mol}}{\text{g}}\right)\right) = 37.33 \text{ g}$$

$$E_{\text{simple}}(\text{TBAB recov.}) = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{107 - 37.33}{37.33} = 1.87$$

$E_{\text{complex}} = E_{\text{simple}}$ because no additional solvents are used.

Ribca, I.; Sochor, B.; Betker, M.; Roth, S. V.; Lawoko, M.; Sevastyanova, O.; Meier, M. A. R.; Johansson, M. *Impact of Lignin Source on the Performance of Thermoset Resins*. *Eur. Polym. J.* **2023**, 194, 112141.

Starting materials: 1 g hardwood lignin (**6 mmol g⁻¹ reactive sites**, ~6 mmol per g lignin of various OH groups), 2.6 g diallyl carbonate (18.3 mmol DAC, 3.00 equiv.), 1.9 g tetrabutylammonium bromide (5.9 mmol TBAB, 1 equiv.)

Recovery of TBAB: 1.672 g (88%)

Desired product: 1.24 g (theoretical yield)

$$m_f = m_i \left(1 + \Delta M_{\text{graft}} \left(\text{reactive sites in } \frac{\text{mol}}{\text{g}}\right)\right) = 1 \text{ g} \left(1 + 40.032 \frac{\text{g}}{\text{mol}} \left(6 \times 10^{-3} \frac{\text{mol}}{\text{g}}\right)\right) = 1.24 \text{ g}$$

$$E_{\text{simple}}(\text{TBAB recov.}) = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{3.828 - 1.24}{1.24} = 2.09$$

$E_{\text{complex}} = E_{\text{simple}}$ because no additional solvents are used.

Duval, A.; Avérous, L. *Cyclic Carbonates as Safe and Versatile Etherifying Reagents for the Functionalization of Lignins and Tannins*. *ACS Sustain. Chem. Eng.* 2017, 5 (8), 7334–7343.

Starting materials: 10 g Soda lignin (**5.8 mmol g⁻¹ reactive sites**, 1.76 mmol AlOH per g lignin, 4.04 mmol COOH groups per g lignin), 66.17 g vinyl ethylene carbonate (580 mmol VEC, 10 equiv.), 0.8 g potassium carbonate (5.8 mmol K₂CO₃, 0.1 equiv.).

Desired product: 10.97 g (isolated yield, 78% of theoretical yield)

Theoretical yield:

$$m_f = m_i \left(1 + \Delta M_{\text{graft}} \left(\text{reactive sites in } \frac{\text{mol}}{\text{g}}\right)\right) = 10 \text{ g} \left(1 + 70 \frac{\text{g}}{\text{mol}} (5.8 \times 10^{-3} \frac{\text{mol}}{\text{g}})\right) = 14.06 \text{ g}$$

Isolated yield = 78%, 10.97 g

$$E_{\text{simple}} = \frac{\sum \text{starting materials} - \text{desired product}}{\text{desired product}} = \frac{76.97 - 10.97}{10.97} = 6.01$$

$E_{\text{complex}} = E_{\text{simple}}$ because no additional solvents are used.

Hydroxyl group functionalized lignin

Table S5 - Summary of E-factor for hydroxyalkylation procedures.

Work	Modification	Functionalizing agent	E _{simple}	E _{complex}	E _{sequence}
Lehnen et al. ²⁷	Hydroxyalkylation	ethylene carbonate	3.59 ^a

^a: theoretical yield calculated for $5.8 \times 10^{-3} \text{ mol g}^{-1}$ reactive sites

EC:

$$m_f = 10.00 \text{ g} (1 + 44.032 \text{ g mol}^{-1} \times 5.8 \times 10^{-3} \text{ mol g}^{-1}) = 12.55 \text{ g}$$

PC:

$$m_f = 10.00 \text{ g} (1 + 58.048 \text{ g mol}^{-1} \times 5.8 \times 10^{-3} \text{ mol g}^{-1}) = 13.37 \text{ g}$$

VEC:

$$m_f = 10.00 \text{ g} (1 + 70.056 \text{ g mol}^{-1} \times 5.8 \times 10^{-3} \text{ mol g}^{-1}) = 14.06 \text{ g}$$

GC:

$$m_f = 10.00 \text{ g} (1 + 74.048 \text{ g mol}^{-1} \times 5.8 \times 10^{-3} \text{ mol g}^{-1}) = 14.30 \text{ g}$$

$E_{\text{complex}} = E_{\text{simple}}$ because no additional solvents are used.

Duval, A.; Vidal, D.; Sarbu, A.; René, W.; Avérous, L. Scalable Single-Step Synthesis of Lignin-Based Liquid Polyols with Ethylene Carbonate for Polyurethane Foams. *Mater. Today Chem.* 2022, 24, 100793.

Starting materials: 40-60 g organosolv lignin (1.89 AlOH, 3.58 ArOH, and 0.06 COOH groups, mmol per g lignin), 160 – 140 g PEG (of average molar mass 200, 300 and 400 g/mol; 3.62, 2.41, 1.81 equiv. with respect to total OH groups in lignin, considering 40 g of lignin), EC 38.96 g (0.44 mol, 2 equiv. with respect to total OH groups in lignin, considering 40 g of lignin), 6.114 g K₂CO₃ (0.044 mol, 0.1 equiv. to EC).

The obtained homogeneous liquid polyols were used without further purification for the foam preparation, therefore no waste is generated.

$$E_{simple} = 0$$

Kühnel, I.; Saake, B.; Lehnen, R. A New Environmentally Friendly Approach to Lignin-Based Cyclic Carbonates. *Macromol. Chem. Phys.* 2018, 219 (7), 1700613.

Oxyalkylation of organosolv lignin with glycerol carbonate

1 g organosolv lignin (5.17 mmol OH per g lignin), 6.10 g glycerol carbonate (51.7 mmol, 10 equiv. in respect of the total of OH in lignin), 79 mg DBU (0.517 mmol, 0.1 equiv. in respect of the total of OH in lignin).

Desired product 1: 1.38 g (theoretical yield)

$$m_f = 1.00 \text{ g} \left(1 + 74.048 \frac{\text{g}}{\text{mol}} (5.17 \times 10^{-3} \frac{\text{mol}}{\text{g}}) \right) = 1.38 \text{ g}$$

$$E_{simple \text{ oxyalkylation}} = \frac{\sum \text{starting materials step 1} - \text{desired product 1}}{\text{desired product 1}} = \frac{7.18 - 1.38}{1.38} = 4.19$$

Transesterification of organosolv lignin with dimethyl carbonate

0.2 g oxyalkylated lignin (5.05 mmol AlOH per g lignin), 0.455 g dimethyl carbonate (5.05 mmol, 5 equiv. in respect of the total of OH in lignin), 0.55 g DMSO (0.5 ml), 0.056 g K₂CO₃ (0.404 mmol, 0.4 equiv. in respect of the total of OH in lignin).

Desired product 2: 0.2087 g (98% theoretical yield)

$$m_f = 0.200 \text{ g} (1 + 25.984 \text{ g mol}^{-1} \times 2.525 \times 10^{-3} \text{ mol g}^{-1}) = 0.213 \text{ g}$$

$$E_{simple \text{ transesterification}} = \frac{\sum \text{starting materials step 2} - \text{desired product 2}}{\text{desired product 2}} = \frac{1.26 - 0.209}{0.209} = 5.04$$

E-factor of whole sequence

Reaction 1: A (lignin) + Reagents → B (oxyalkylated lignin(OL))

Reaction 2: B (oxyalkylated lignin) + Reagents → C (final product)

Reaction 1: $E_{\text{complex}}: 4.19 \frac{\text{kg waste}}{\text{kg OL}}$

Reaction 2: $E_{\text{complex}}: 5.04 \frac{\text{kg waste}}{\text{kg final product}}$; Multiplier Reaction 1: $\frac{\text{kg OL}}{\text{kg final product}} = \frac{0.2}{0.2087} = 0.958$

$E_{\text{sequence}}: 5.04 \frac{\text{kg waste}}{\text{kg final product}} (\text{Reaction 2})$
 $+ 4.19 \frac{\text{kg waste}}{\text{kg OL}} \times 0.958 \frac{\text{kg OL}}{\text{kg final product}} (\text{Reaction 1})$
 $= 9.055 \frac{\text{kg waste}}{\text{kg final product}}$
